METHODOLOGY FOR THE PRODUCTION OF ACCURATE VISUAL REPRESENTATIONS (AVR)

1. INTRODUCTION

This methodology outlines the process followed to produce Accurate Visual Representations (AVR) in accordance with the *Landscape Institute's Technical Guidance Note 06/19*. This document ensures that visual representations adhere to Type 4 Survey Verifiable standards, providing reliable and verifiable imagery for assessment and decision-making.

2. VIEWPOINT COLLATION AND SURVEYING STANDARDS

For the selection and collation of viewpoints, a qualified surveyor attended the site equipped with professional surveying equipment and a full-frame DSLR camera with a fixed 50mm lens, in compliance with Type 4 Survey Verifiable standards. The following steps were undertaken:

- Survey control points were established and geo-referenced using GPS and total station survey methods.
- Camera positions and viewing directions were recorded with precision, ensuring that all necessary metadata (e.g., height, focal length, and location) was documented accurately.
- Photographs were taken under appropriate lighting and atmospheric conditions to maintain consistency with guidance standards.

Table 2 Visualisation Types 1-4		Type 1	Type 2	Type 3	Type 4
Aim of the Visualisation		To represent context and outline or extent of development and of key features	To represent 3D form of development / context	To represent appearance, context, form and extent of development	To represent scale, appearance, context, form, and extent of development
Photographic Equipment	Tripod	Recommended but discretionary	Not relevant	Recommended	Necessary
	Panoramic head	Not relevant		Recommended for panoramas	Necessary for panoramas
	Minimum Camera / Lens	Cropped frame or FFS + 50mm	Not relevant	Cropped frame or FFS + 50mm	Full Frame Sensor (FFS) + 50mm FL lens <sup>1</sup>
Locational Accuracy	Source of camera/viewpoint location data	GPS, OS Maps, geo-referenced aerial photography	Varies according to technology	Use good quality data: GPS, OS Maps, geo-referenced aerial photography, LiDAR	Use best available data: High resolution commercial data, LiDAR, GNSS, or measured / topographic surveys
	Survey-verified <sup>2</sup>	Not relevant			When appropriate
Data & Presentation	Verifiable (SNH) <sup>3</sup>	Not relevant			Required
	3D model	Not required	Required		
	Image Enlargement <sup>4</sup>	Typically 100%	Not relevant	Typically 100%	100% - 150%
	Form of Visualisation	sketch / outline / arrows	massing / wireline / textured	wireline / massing / rendered / textured to agreed AVR level <sup>5</sup>	
	Viewpoint mapping	Dedicated viewpoint location plan			Dedicated viewpoint location plan, + individual inset maps recommended
Reporting of methodology and data sources		Outline description of sources and methodology recommended		Data, sources and methodology recommended	Verifiable data, sources and methodology required

3. MODELLING AND VISUAL REPRESENTATION

Technical Guidance Note 06/19: Figure A6-1: Accurate Visual Representation (AVR) Levels 0-3 (Images ©Nicholas Pearson Associates)

Tess Square Development (Level 3)

For the Tess Square development, an existing model created for planning purposes was utilised. To ensure accurate representation:

- The model was aligned with surveyed viewpoint data.
- Vegetation was added with the foliage removed where necessary to reflect seasonal screening effects at the time of the photography.

Butts Square Development (Level 1)

As the Butts Square development remains at the outline stage, a new model was produced using the latest design information. The following parameters were applied:

- Floor-to-floor heights were set at 2700mm to provide a realistic representation of internal layouts.
- Roof pitches were defined based on building types:
- Two-storey buildings: 40-degree roof pitch.
- Bungalows: 37.5-degree roof pitch.
- Garages: 35-degree roof pitch.

Buildings were integrated with the topography, ensuring that front entrances intersected with the existing grade at +150mm to account for threshold levels.

4. IMAGE PROCESSING AND PRESENTATION

The rendered models were superimposed onto the site photography using precise alignment techniques, ensuring accurate scale and perspective.

Adjustments were made to lighting and shading to match environmental conditions recorded during photography.

Final outputs were verified against survey data and checked for compliance with the Landscape Institute's AVR standards.
